Reflective Journal Entry: Lab 1 – Exploring Azure AI Services

Introduction

This reflection covers my experience using Azure AI Content Safety in Lab 1. The goal was to explore AI-driven moderation and its practical applications.

Description of Experience

During the lab, I focused on navigating Azure AI Content Safety, paying attention to the menus and UI to build intuition about the platform. While exploring, I found myself confused about the difference between Azure AI and Azure OpenAI. Though not part of the lab, my curiosity led me to research their distinctions and use cases. This was my second introduction to an AI platform—my first being Amazon image training. Both platforms felt unfamiliar as a non-developer, but I took time to explore Azure and familiarize myself with its layout.

Personal Reflection

Thoughts and Feelings: Engaging with the AI moderation tools was interesting. The structured interface made it easy to experiment with different features.

Analysis and Interpretation: The lab showed how AI classifies harmful content, emphasizing its strengths and need for human oversight.

Connections to Theoretical Knowledge: Reinforced concepts from AI ethics discussions, highlighting AI's limitations in nuanced moderation.

Critical Thinking: My side research clarified how various AI services fit into broader industry needs.

Discussion of Improvements and Learning

Personal Growth: Exploring the platform deepened my understanding of AI services and their applications.

Skills Developed: Gained experience in navigating Azure AI services and their moderation capabilities.

Future Application: Plan to explore more AI services and refine moderation strategies.

Conclusion

This lab provided hands-on experience with Azure AI moderation, showcasing its potential and challenges. I aim to continue navigating AI tools and their applications in digital environments.

These keys are used to access your Azure AI services API. Do not share your keys. Store them securely-- for example, using Azure Key Vault. We also recommend regenerating these keys regularly. Only one key is necessary to make an API call. When regenerating the first key, you can use the second key for continued access to the service.

confidence interval. A well-trained model, like one of Azure AI's out-of-the-box models, can return results that have a high probability of matching what a human would label the result. Each time you run a test, you call the model again.

5. Now try another sample. Select the text under Violent content with misspelling. Check that the content is displayed in the box below.

6. Click **Run test** and inspect the results in the Results panel again.

You can run tests on all the samples provided, then inspect the results.

Check out the keys and endpoint

These capabilities you tested can be programmed into all sorts of applications. The keys and endpoint used for application development can be found both in the Content Safety Studio and the Azure Portal.

1. In the Content Safety Studio, navigate back to the **Settings** page, with the **Resources** tab selected. Look for the resource you used. Scroll across to see the endpoint and key for your resource.

2. In the Azure Portal, you will see that these are the *same* endpoint and *different* keys for your resource. To check it out, head to the **Azure Portal** <https://portal.azure.com?azure-portal=true>. Search for *Content Safety* on the top search bar. Find your resource and click on it. On the left-hand menu, look under *Resource Management* for **Keys and Endpoints**. Select **Keys and Endpoints** to view the endpoint and keys for your resource.

After you have finished, you can delete the Content Safety resource from the Azure Portal. Deleting the resource is a way to reduce costs that accrue when the resource exists in the subscription. To do this, navigate to the **Overview** page of your Content Safety resource. Select **Delete** at the top of the screen.
